The assumptions

The goal for this presentation

- build a simple, working app tracking ISS
- make it work on all major platforms: Android, iOS, JVM and web
- DRY and KISS
- have fun writing the code
- show how to start with development of KMP apps, and what are the nice tools to use

Why choose Kotlin Multiplatform?

- write code once, run it everywhere
- share code between platforms, end with native executables
- migrate the existing codebase to KMP gradually
- option to easily define target-specific behavior

(Live) Coding ISS

1. play with API
2. HTTP client and model serialization
3. text-based UI and shared view model
4. styled map component with controls

- start with working KMP project, extend it to your needs
- results:
 - common, performant UI in shared code
 - model and utils shared between clients and server, and different target platforms
- using KMP libraries makes it easy to add features
- building UI with Compose Hot Reload is fast, and a pleasure

- book [Kotlin in Action, Second Edition](#) to start with Kotlin
- [KMP docs](#) with tutorials
- [klibs.io](#) for searching through KMP libraries
- [Bring!](#) — KMP full app sample, with clients and server
